

Variant Effect Predictor

New job

Clear form | Close

Species:

 Homo_sapiens X

Assembly: *GRCh38.p14*
[Change species](#)
If you are looking for VEP for Human GRCh37, please go to [GRCh37 website](#) .

Name for this job (optional):

_TO_nonsize_TLOD4-GERMQ25_alph

Input data:

Either paste data:

Examples: [Ensembl default](#), [VCF](#), [Variant identifiers](#), [HGVS notations](#), [SPDI](#)

Or upload file:

เลือกไฟล์

ไม่ได้เลือกไฟล์ใด

Click [here](#) to download the previously uploaded file.

Or provide file URL:

Transcript database to use:

- ☐ Ensembl/GENCODE transcripts
- ☒ Ensembl/GENCODE basic transcripts
- ☐ Ensembl/GENCODE primary transcripts
- ☐ RefSeq transcripts
- ☐ Ensembl/GENCODE and RefSeq transcripts

Additional configurations:

Identifiers

Additional identifiers for genes, transcripts and variants

Filtering options

Pre-filter results by frequency or consequence type

Filters

Filter by frequency:

No filtering

Exclude common variants

Advanced filtering

Return results for variants in coding regions only:

Restrict results:

Show all results

NB: Restricting results may exclude biologically important data!

Advanced options

Additional enhancements

Advanced options

Buffer size:

5000

NB: When the **Regulatory data** option is selected then due to the large amount of regulatory data available, the **maximum buffer size** is automatically reduced from the default value of **5000** to **500**. This reduces the memory requirement but might increase the run time. If you find that your jobs are still failing due to memory limitations then you can select a value **lower than 500**.

Right align variants prior to consequence calculation:

No
